$ What is aircli?

```
                --                \                    --   ---
                    ---            \\          ---
     ---              --
         --                 ---->>>                --                ---
                                 //
   --       ---                 /                  ---          --
                      ---
```

A terminal-first, airport management system handling everything an airport needs.

$ Motivation

- Practical Use-Case for Learning Modular Design
- Unified Way to Track a Complex System.
- Reinforces error handling
- Easily expandable (tickets, weather module, energy module, etc.)

$ Key Features

- Flight Creation
- Booking Panel for Passengers
- Dashboard
- Role-Based Access (Admin, Passenger, etc.)
- Payment Handling
- Luggage Handling

$ Tools & Technologia

```
Language: C++
Features: Object-Oriented Design
          File-Handling
          Custom Error Handling
          Data Persistence & Serialization
          State Management (delay, cancellation, etc.)
          Triggered events (overbooking, lost baggage, etc.)
          Search & Query Operations
          Improved CLI Experience
```

$ Timeline

```
                                  \
                                   \\
                                ---->>>
                                   //
                                  /
Entity                                          Extra
Creation                                        Features

          Core                   MID                     Error
          Features                                       Handling

                                    \
                                     \\
BEFORE MID                        ---->>>          AFTER MID
----------                           //           ----------
                                    /
```
